14. ABSTRACT

The purpose of this Software Test Description (STD) is to establish formal test cases to be used by personnel tasked with the installation and verification of the Globally Relocatable Navy Tide/Atmospheric Modeling System (PCTides). This STD describes the test and evaluation criteria necessary to verify that the PCTides software has been properly implemented. Three test cases have been selected to exercise the software. The test inputs, expected results, criteria for evaluation of those results, and assumptions regarding the test itself are described. This document, along with the Software Requirements Specification (Preller et al., 2001) and the Software Design Description (Hubbert et al., 2001) form the standard documentation package for the OAML PCTides.

15. SUBJECT TERMS

SOFTWARE TEST DESCIPTION (STD) FOR THE GLOBALLY RELOCATABLE NAVY TIDE/ATMOSPHERIC MODELING SYSTEM (PCTIDES)

1.0 Scope

This Software Test Description (STD) establishes formal test cases to be used by personnel tasked with the installation and verification of the Globally Relocatable Navy Tide/Atmosphere Modeling System (PCTides).

1.1 Identification

PCTides is a high resolution hydrodynamic model that characterizes coastal flooding due to storm surges. It consists of a Mesoscale Atmospheric Prediction System (MAPS) and the Coastal Ocean Model (GCOM2D and GCOM3D), a 2- and 3-dimensional barotropic ocean model developed by the Global Environmental Modeling Services (GEMS). The PCTides products can be used in sea state and tidal forecasting, disaster planning and management, and coastal engineering and storm impact studies (Hubbert and McInness, 1999).

MAPS is a hydrostatic primitive equations model used to provide high resolution spatial representation of anemometer level winds and surface pressure field as atmospheric boundary conditions for the 2- or 3-dimensional barotropic ocean models (GCOM2D/3D). A turbulence closure scheme has been designed to allow the model to be run with its lowest model level at anemometer height, providing direct simulation of winds at this level. MAPS is capable of being run on varying spatial resolution anywhere in the globe.

GCOM2D is a depth-integrated shallow water model designed to model currents and sea levels on or near continental shelves. It features a wetting and draining algorithm for the simulation of coastal flooding due to tides or storm surge. GCOM3D is the three-dimensional counterpart of GCOM2D. It is a barotropic model for applications where current structure with vertical depth is required and tidal and wind forcing are dominant. In tropical applications, atmospheric forcing for GCOM2D/3D is provided by a hurricane vortex model rather than by MAPS.

1.2 Document Overview

This Software Test Description describes the test and evaluation criteria necessary to verify that the PCTides software has been properly implemented. Three test cases have been selected to exercise the software.

The test inputs, expected results, criteria for evaluation of those results, and assumptions regarding the test itself are described. This document has been prepared in accordance with the Software Documentation Standards for Environmental System Product Development, released in January 1999 and distributed by NAVOCEANO.

Manuscript approved April 22, 2002.

Shum, C.K., Woodworth, P.L., Andersen, O.B., Egbert G.D., Francis, O., King, C., Klosko, S.M., Le Provost, C., Li, X., Molines, J.-M., Parke, M.E., Ray, R.D., Schlax, M.G., Stammer, D., Tierney, C.C., Vincent, P., and Wunsch, C.I., (1997) Accuracy Assessment of Recent Ocean Tide Models. *J. Geophys. Res.*, **102**: 25173-25194.

3.0 Test Preparations

Three complete test cases are provided to exercise the installed PCTides capability. These are delivered along with the PCTides software, including sufficient input data files for the user to replicate the results shown here. It is assumed that the PCTides software has been installed, according to separate instructions, before attempting these runs.

3.1 Hardware Preparation

The execution of PCTides does not require extensive hardware configuration or modification and can be easily loaded onto either the PC Windows/DOS or UNIX operating systems. In order to successfully execute PCTides there must be at least 256 MB of RAM. The system itself requires 400 MB of disk space in both the PC Windows/DOS and UNIX operating systems.

3.2 Software Preparation and Test Execution

The PCTides User's Manual provides specific instructions on the execution of the software. The model is run through use of a PC Windows interactive menu or a command prompt. Command prompt operation in the PC window environment is identical to UNIX operation.

The directory structure for operational use of the system is as follows:

\gems\work : working directory in which all calculations are carried out.
\gems\data : directory containing all tidal and topographical files used by GCOM.
\gems\gcom : code directory containing all executable code.
\gems\gridgen : directory containing the ASA grid generator files-PC only.
\gems\TESTAREA[1 2 3] : directory containing files for test case execution.

Note: The [1 2 3] in the TESTAREA directory denotes a choice between Test Case 1, Test Case 2 or Test Case 3. If working with Test Case 1, for example, the test directory would be \gems\TESTAREA1\ .

Execution of all activities by command prompt should be carried out in the "work" directory. These directories are transparent when using the PC Windows interactive menu. If a UNIX system is used the notation for directories must be "/" instead of "\".

3.3 Description of Test Cases

The test cases chosen for PCTides verification reflect areas of varying location, bathymetry, grid resolution, and oceanographic characteristics. The cases reflect the most common run scenarios the user will encounter, such as running without wind forcing (Test Case 1), with winds (Test Case 2), and doing nested grid runs (Test Case 3). Each test case provides instructions for running the test, examples of input files, a map of the test area and brief examples of output files by which the user may compare test results.

3.4 Input Files

Three user specified input files must be edited or copied prior to running the test cases. The files are topog.dat file, stations.dat and gcom.dat. For Test Cases 1, 2 or 3, the user will copy an existing file provided upon installation of PCTides rather than creating their own.

3.4.1 Bathymetry File (topog.dat)

For a standard PCTides run, grid generation is a required input file for creating a new bathymetry. This is accomplished by editing the gridgen.dat file for the model domain of interest and then running `~/gems/gcom/gridgen`, which reads the latitude and longitude limits and resolution stored in the "gridgen.dat" file. "Gridgen" calculates the bathymetry and topography from the global direct access files and writes the data to the file "topog.dat" in the "\gems\work" directory. However, for the purposes of these test cases an existing bathymetry is used. The user copies an existing topog.dat file using the command `cp ~ /gems/TESTAREA[1 2 3]/topog.dat`. Appendix A provides an excerpt of a topog.dat file.

3.4.2 Stations File (stations.dat)

One of the features of the model is to produce time series output of sea levels and ocean currents at specified locations. The location of these "stations" must be defined prior to model execution by setting up a "stations.dat" file. The "stations.dat" file may have up to 12 stations defined, one per line, as latitude, longitude, and name. The user is advised to have at least one output station defined for each model run. An input file for station locations may be created in stations.dat, or an existing stations.dat file may be copied using `cp ~/gems/TESTAREA[1 2 3]/stations.dat`. During the model run, time series data of sea levels, current speeds and directions are written to files with the station name and a ".tsd" extension. These files may be plotted at the end of the run for comparison with observations or tidal height predictions (".thp" files). A sample stations.dat file is shown on the following page.

Latitude (-90.0 to 90.0)	Longitude (0 to 360 E)	Station Name (max 8 characters)	Model Output Level (1 for GCOM2D)
26.17000	56.55000	Pgulf1	1
26.70000	56.28000	Pgulf2	1
24.00000	58.00000	Pgulf3	1
26.50000	53.40000	Pgulf4	1
25.67000	52.40000	Pgulf5	1
24.45000	53.37000	Pgulf6	1
27.00000	49.72000	Pgulf7	1
29.27000	50.33000	Pgulf8	1
29.83000	48.72000	Pgulf9	1

3.4.3 Parameter File (gcom.dat)

The gcom.dat file is edited, or an existing gcom.dat file is copied into the "work" directory, to select the parameter options for the model run. A typical gcom.dat file is shown below.

Line	Parameter	Typical Value
1	wind flag (0=off, 1=on)	0
2	tide flag (0=off, 1=on, 2=on + tidal data assimilation)	2
3	nesting flag (0=off, 1=on)	0
4	screen flag (0=text, 1=vectors)	0
5	inundation flag (0=off, 1=on)	0
6	output file time interval (hours, 0=none)	1.0
7	tidal start time, time zone (hh,mm,dd,mm,yyyy,hours)	00 00 23 06 1999 19.0
8	maximum model run time (hours)	48

3.5 Tidal Boundary Conditions

Tidal boundary conditions are derived from the global tide model, Finite Element Solutions, version 95.1 (FES95.1/2.1) (Shum et al., 1997). Tidal boundary conditions are derived for the model region from the global tidal files for eight constituents by determining the grid from the topography file and then writing the files:

m2.dat	2n2.dat
s2.dat	ol.dat
n2.dat	kl.dat
k2.dat	ql.dat

3.6 Wind Forcing

The winds to force the ocean model may be derived from a Navy Product wind (NOGAPS, DAMPS, or COAMPS) or MAPS field, entered manually or developed using the hurricane model. The Navy Product wind or MAPS files may be used to derive surface winds and atmospheric pressures to force the ocean model. The system looks in an external directory for the NOGAPS/COAMPS output files.

These files are interpolated to the model grid and written to the binary sequential file “atmos.dat”. PCTides has been updated to use the Navy’s METCAST winds. Test Case 2 incorporates COAMPS winds to provide wind forcing to the GCOM model.

3.7 Nested Model Runs

GCOM2D may be nested inside a previous run of either GCOM3D or GCOM2D. Similarly GCOM3D may be nested inside a previous run of either GCOM3D or GCOM2D. The model will look for the output file from the previous run to nest inside, so it is important to make sure the two runs (coarse and fine grids) are consecutive. Nesting may be turned “on” (flag=1) or “off” (flag=0). The sequence of events for a typical nesting run is as follows:

1. Create a bathymetry grid for the coarse model domain.
2. Generate tides for the coarse domain.
3. Generate winds for the coarse domain.
4. Set the key parameters for the coarse model run (winds=on, tides=on, nesting=off, inundation=off, output file time interval=not to infrequent in order to pass sufficient information to the nested model, i.e. no greater than one hour for tidal modeling).
5. Run GCOM2D or GCOM3D.
6. Create a bathymetry grid for the fine model domain within the coarse domain.
7. Generate winds for the fine domain.

8. Set the key parameters for the fine model run (winds=on, tides=on or on + tidal data assimilation, nesting=on, inundation=off or on).
9. Run GCOM2D or GCOM3D.
10. Display results.

3.8 Output Files

Various forms of display options are available for the PC user. The display code has been written for the PC and so there are no display options when running under UNIX. The display options may be run under the PC Windows Menu or at the command prompt.

When the user specifies stations in the menu or edits the "stations.dat" file the model produces time series output at those locations and writes to a file with the station name and an extension of ".tsd". The ".tsd" file contains the station information, date, time, tidal current speeds and tidal current direction. The output time for this file is constant, i.e., ten or twelve minutes. Tidal current speeds are in knots and the current direction is in degrees from true north, where north equals 0°. As the model runs, the tidal predictions for the IHO tidal station closest to the selected model station are also written to a file with the station name and the extension ".thp". The ".thp" file contains the same information as the ".tsd" file. However, the observation station does not have the current information and so the current speed and direction columns contain zeros. The third output file, gcom.out, is a direct access file of the full horizontal array of tidal heights and tidal current velocities. It is required as an input file for the command `~/gems/gcom/omfield`, which takes the direct access file and converts it to an ASCII file for the horizontal array.

4.0 Test Descriptions

Three test cases are provided for the purpose of verifying the installation of PCTides on the user's system. In this STD, the test cases are simply presented so that the user may verify that each executes correctly.

4.1 Test Case 1

Test Case 1 area is located on the U.S. East Coast near Chesapeake Bay, Virginia. Figure 1 provides general information about the test area with a map of the model domain marking each of the eight times series stations. Test Case 1 will be run without winds (wind flag=0).

Area: East Coast near Chesapeake Bay, VA USA

Date: July 31, 2000

Geographic Coverage:
Lon min = 74 W
Lon max = 78 W
Lat min = 35 N
Lat max = 40 N

Grid Resolution: 4.4 km (68 x 141)

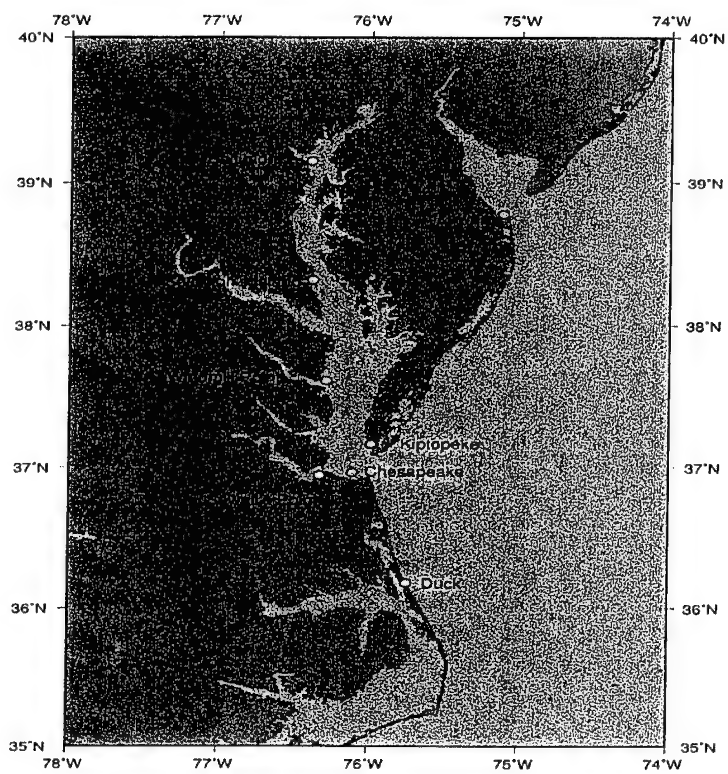

Figure 1. Test Case 1 grid information.

4.1.1 Test Case 1 Procedure

1. Copy existing topog.dat file:

`cp ~/gems/TESTAREA1/topog.dat`

into the work directory: `~/gems/work/topog.dat .`

See Appendix A for an excerpt from the topog.dat file.

2. Copy existing stations.dat file (See Figure 2):

`cp ~/gems/TESTAREA1/stations.dat`

into the work directory: `~/gems/work/stations.dat .`

36.18330	284.25339	duc	1
36.94670	283.67001	sew	1
36.96670	283.88699	che	1
37.61500	283.70999	wdm	1
37.16700	284.01199	kip	1
39.15000	283.60001	bal	1
38.32000	283.61499	sol	1
38.78000	284.88000	lew	1

Figure 2. Test Case 1 stations.dat file.

3. Copy existing gcom.dat file (See Figure 3):

`cp ~/gems/TESTAREA1/gcom.dat`

into the work directory: `~/gems/work/gcom.dat .`

```
                  0 : WIND FLAG (0=off, 1=on)
                  2 : TIDE FLAG (0=off, 1=on, 2=assimilate data)
                  0 : NESTING FLAG (0=off, 1=on)
                  0 : SCREEN FLAG (0=text, 1=vectors, 2=3Dmesh)
                  0 : INUNDATION FLAG (0=off, 1=on)
                6.0 : OUTPUT FILE TIME INTERVAL (hours,0=none)
0 0 31 07 2000  0.0 : START TIME & TIME ZONE
                      (hh,mm,dd,mm,yyyy -tides only)
                 48 : MAXIMUM MODEL RUN TIME (hours)
```

Figure 3. Test Case 1 gcom.dat file.

Note that the wind flag should be = 0 (no winds) and the tide flag is set to assimilate data (flag=2).

4. Run the model using the following three commands:

   a. `~/gems/gcom/tides`
      Assimilates tidal data.

   b. `~/gems/gcom/gcom2d`
      Runs the PCTides GCOM2D model.

   c. `~/gems/gcom/omfield`
      Runs "omfield", which changes "gcom.out" into an ASCII file, thus producing a full horizontal array of height, speed and direction. See the User's Manual Section 4.6.1 for details on running "omfield".

4.1.2 Expected Test Results

The execution of Test Case 1 results in a "gcom.out" file, a ".tsd" file and a ".thp" file for each station. The user should compare the ".tsd" and ".thp" files to check for accuracy in the model.

4.1.3 Model Output Results

The text of the ".thp" and ".tsd" files generated by Test Case 1 is provided in Figures 4 and 5 on the following page. The tables represent the first thirty lines of output from the files generated for the Kiptopeke Station. The user's output files when compared with the examples should be identical. The example files for the remaining Test Case 1 stations are provided in Appendix B.

Figure 5. Excerpt from "kip.tsd" file for Test Case 1. Station is Kiptopeke, Virginia, USA.

4.1.4 Assumptions and Constraints

The successful replication of the preceding PCTides results is dependent on the application of identical input data files. It is essential, therefore, that the appropriate files be correctly installed and available to the models.

4.2 Test Case 2

Test Case 2 is located in Puget Sound near Seattle, Washington. Figure 6 provides general information about the test area with a map of the model domain marking the two times series stations. Test Case 2 will be run with winds (wind flag=1).

Area: Puget Sound, Washington, USA

Date: February 8, 2002

Geographic Coverage:
Lon min = 122 W
Lon max = 126 W
Lat min = 47 N
Lat max = 51 N

Grid Resolution: 2.1 km (132 x 182)

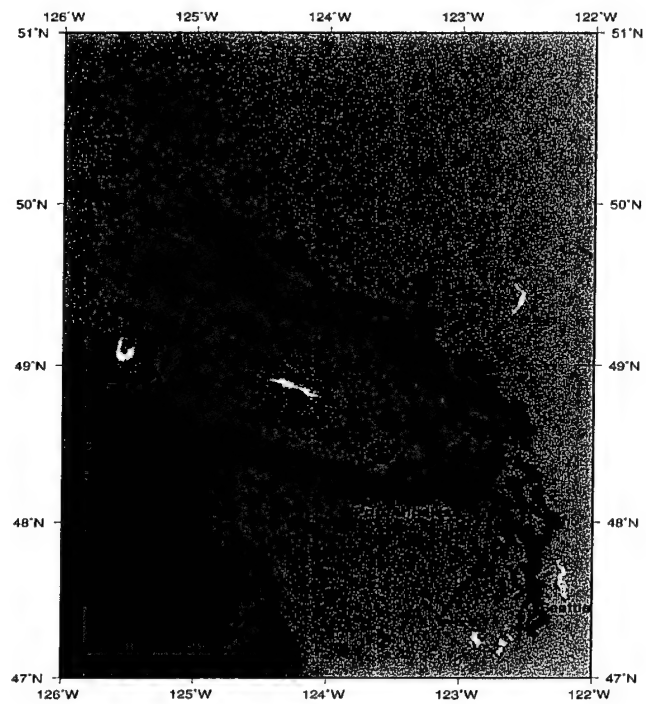

Figure 6. Test Case 2 grid information.

4.2.1 Test Case 2 Test Procedure

1. Copy existing topog.dat file to the work directory:

cp `~/gems/TESTAREA2/topog.dat`

to: `~/gems/work/topog.dat .`

See Appendix A for an excerpt from a sample topog.dat file.

2. Copy existing stations.dat file (Figure 7) into the work directory:

```
cp          ~/gems/TESTAREA2/stations.dat

to:         ~/gems/work/stations.dat .
```

48.18500	236.57001	ang	1
47.55000	237.59001	sea	1

Figure 7. Test Case 2 stations.dat file.

3. Copy existing gcom.dat file (See Figure 8) into the work directory:

```
cp          ~gems/TESTAREA2/gcom.dat

to:         ~gems/work/gcom.dat .
```

```
                      1 : WIND FLAG (0=off, 1=on)
                      2 : TIDE FLAG (0=off, 1=on, 2=assimilate data)
                      0 : NESTING FLAG (0=off, 1=on)
                      0 : SCREEN FLAG (0=text, 1=vectors, 2=3Dmesh)
                      0 : INUNDATION FLAG (0=off, 1=on)
                    6.0 : OUTPUT FILE TIME INTERVAL (hours,0=none)
   0 0 31 07 2000 0.0 : START TIME & TIME ZONE
                          (hh,mm,dd,mm,yyyy -tides only)
                     48 : MAXIMUM MODEL RUN TIME (hours)
```

Figure 8. Test Case 2 gcom.dat file.

Note that for Test Case 2 the wind flag is "on" (flag=1).

4. Prepare COAMPS Eastern Pacific wind forcing to use in the tide model. The following commands will take IEEE COAMPS E_PAC fields and write them into an ASCII file called atmos.dat. For this test, copy the atmos.dat file into the work directory:

```
cp    ~/gems/TESTAREA2/atmos.dat

to:   ~/gems/work/atmos.dat.
```

For Naval Oceanographic Office users, the code required to pull in the COAMPS fields for the atmos.dat file has been automated at NAVOCEANO.

5. Run the model using the following commands:

a. `~/gems/gcom/tides`
   Assimilate tidal data.

b. `~/gems/gcom/gcom2d`

Runs the PCTides GCOM2D model.

c. `~/gems/gcom/omfield`

Runs "omfield", which changes "gcom.out" into an ASCII file, thus producing a full horizontal array of height, speed and direction. See the User's Manual Section 4.6.1 for details on running "omfield".

4.2.2 Expected Test Results

The execution of Test Case 2 results in a "gcom.out" file, a ".tsd" file and a ".thp" file for both stations. The user should compare the ".tsd" files with the ".thp" files to check for accuracy in the model.

4.2.3 Model Output Results

The first thirty lines of output from the ".thp" and ".tsd" files generated by Test Case 2 is provided for the Seattle station in Figures 9 and 10. The user's output files when compared with the examples should be identical. The example output for the Port Angeles station is listed in Appendix B, Figures B-15 and B-16.

 20020208   548 -1.174  0.176 152.3
```

Figure 10. Excerpt from the Seattle station "sea.tsd" output file for Test Case 2.

4.2.4 Assumptions and Constraints

The successful replication of the PCTides results shown above is, obviously, dependent on the application of identical input data files. It is essential, therefore, that the appropriate files be correctly installed and available to the models.

4.3 Test Case 3

Test Case 3 demonstrates a nested model scenario. It includes instructions and output for both the coarse and finer resolution model runs. The geographic location for Test Case 3 coarse run is the coastline of the United Kingdom including ten stations. The location for the nested case is along the Bristol Channel with one station near Ilfracombe, England. Figures 11 and 12 provide general information and maps for the coarse test area and the finer resolution nest region, respectively.

Area: Coastline of United Kingdom

Date: July 31, 2000

Geographic Coverage:
Lon min = 7.0 E
Lon max = 12.0 W
Lat min = 46.0 N
Lat max = 65.0 N

Grid Resolution: 9.5 km
(154 x 227)

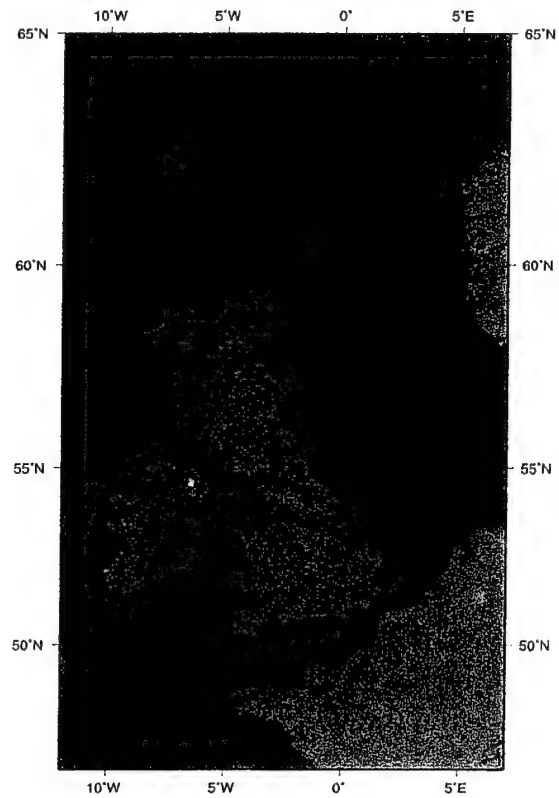

Figure 11. Test Case 3 coarse area grid information.

Area: Bristol Channel in United Kingdom.

Date: July 31, 2000

Geographic Coverage:
Lon min = 2.0 W
Lon max = 8.0 W
Lat min = 50.6 N
Lat max = 52.4 N

Grid Resolution: 3.1 km (138 x 70)

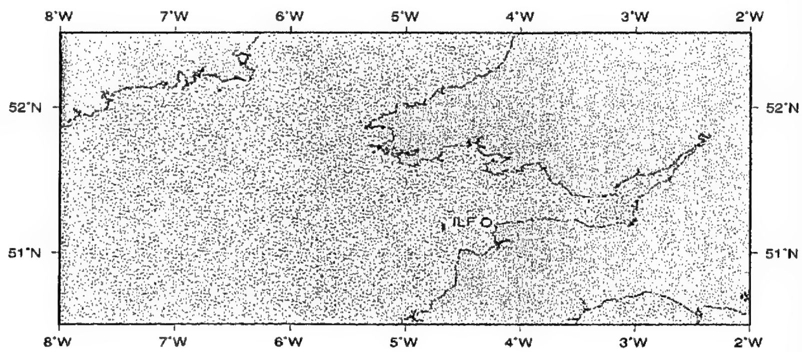

Figure 12. Test Case 3 nested area grid information.

4.3.1 Test Case 3 Test Procedure

Coarse Model Run

1. Copy existing topog.dat file into the work directory:

cp `~/gems/TESTAREA3/topog_coarse.dat`

to: `~/gems/work/topog.dat .`

See Appendix A for an excerpt from a sample topog.dat file.

2. Copy existing stations.dat file (See Figure 13):

cp `~/gems/TESTAREA3/stations.dat`

to: `~/gems/work/stations.dat .`

57.14500	357.92020	abe	1
51.21000	355.70001	ilf	1
51.04000	1.30000	dov	1
54.03000	356.60001	hey	1
53.63000	359.91010	imm	1
60.16000	358.75000	ler	1
53.50000	356.65021	liv	1
50.65000	0.05000	new	1
51.45000	0.72000	she	1
58.21000	353.66000	sto	1

Figure 13. Test Case 3 stations.dat file.

3. Copy gcom.dat file (See Figure 14) into the work directory:

```
cp          ~gems/TESTAREA3/gcom_coarse.dat
```

to: `~gems/work/gcom.dat .`

Note that the Nesting Flag should be "off" (flag=0) for the coarse run. Test Case 3 is being run without winds; so the wind flag is also "off" (flag=0). The tide flag is set to assimilate data (flag=2).

```
                    0 : WIND FLAG (0=off, 1=on)
                    2 : TIDE FLAG (0=off, 1=on, 2=assimilate data)
                    0 : NESTING FLAG (0=off, 1=on)
                    0 : SCREEN FLAG (0=text, 1=vectors, 2=3Dmesh)
                    0 : INUNDATION FLAG (0=off, 1=on)
                  1.0 : OUTPUT FILE TIME INTERVAL (hours,0=none)
0 0 31 07 2000 0.0 : START TIME & TIME ZONE
                      (hh,mm,dd,mm,yyyy -tides only)
                   48 : MAXIMUM MODEL RUN TIME (hours)
```

Figure 14. Test Case 3 coarse run gcom.dat file.

4. Run the model using the following commands:

   a. `~/gems/gcom/tides`
      Assimilates tidal data.

   b. `~/gems/gcom/gcom2d`
      Runs the PCTides GCOM2D model.

The execution of this initial run of Test Case 3 results in a "gcom.out" file, a ".tsd" file and a ".thp" file for each station.

5. Save out the coarse run .tsd and .thp files under a new name, as seen in the example below using a "_c" after the station name. This allows for the finer resolution run to output new .tsd and .thp files and not overwrite the coarse run's files.

```
mv abe.tsd abe_c.tsd
mv ilf.tsd ilf_c.tsd
mv dov.tsd dov_c.tsd
mv hey.tsd hey_c.tsd
mv imm.tsd imm_c.tsd
mv ler.tsd ler_c.tsd
mv liv.tsd liv_c.tsd
mv new.tsd new_c.tsd
mv she.tsd she_c.tsd
mv sto.tsd sto_c.tsd
mv abe.thp abe_c.thp
mv ilf.thp ilf_c.thp
mv dov.thp dov_c.thp
mv hey.thp hey_c.thp
mv imm.thp imm_c.thp
mv ler.thp ler_c.thp
mv liv.thp liv_c.thp
mv new.thp new_c.thp
mv she.thp she_c.thp
mv sto.thp sto_c.thp
```

Nested Run

1. Copy the existing nested grid topography to the work directory:

cp `~/gems/TESTAREA3/topog.dat`

to: `~/gems/work/topog.dat.`

2. Copy the gcom.dat for the fine resolution run (See Figure 15):

cp `~/gems/TESTAREA3/gcom.dat`

to: `~/gems/work/gcom.dat.`

Make sure that the nesting flag is turned "on" (flag=1), the tide flag is turned "off" (flag=0), and the wind flag is turned "off" (flag=0).

```
                         0 : WIND FLAG (0=off, 1=on)
                         0 : TIDE FLAG (0=off, 1=on, 2=assimilate data)
                         1 : NESTING FLAG (0=off, 1=on)
                         0 : SCREEN FLAG (0=text, 1=vectors, 2=3Dmesh)
                         0 : INUNDATION FLAG (0=off, 1=on)
                       1.0 : OUTPUT FILE TIME INTERVAL (hours,0=none)
   0 0 31 07 2000 0.0 : START TIME & TIME ZONE
                             (hh,mm,dd,mm,yyyy -tides only)
                        48 : MAXIMUM MODEL RUN TIME (hours)
```

Figure 15. Test Case 3 nested run gcom.dat file.

3. Run the model using the following commands:

   a. `~/gems/gcom/gcom2d`
      Run the PCTides GCOM2D model.

   b. `~/gems/gcom/omfield`
      Runs "omfield". See the User's Manual Section 4.6.1 for details on running "omfield".

4.3.2 Expected Test Results

The execution of Test Case 3 results in a "gcom.out" file and a ".tsd" file for each station, for both the coarse and the finer resolution grids. The ".thp" files are also generated during both the coarse and high resolution runs.

4.3.3 Model Output Results

The following tables represent the first thirty lines of output from the nested run files generated for the Ilfracombe station. The output from the ".thp" file (Figure 16) provides the tide information for comparison with the ".tsd" files from the nested case. The output from the ".tsd" file generated by the nested run is shown in Figure 17. Results from the remaining nine stations of the coarse run are available in Appendix B, Figures B-17 through B-34. The user's output files when compared with the examples should be identical.

Figure 17. Excerpt from the Ilfracombe station "ilf.tsd" output file for Test Case 3 nest case.

It is expected that the higher resolution (nested) case results will compare better to observations than the coarser model results.

4.3.4 Assumptions and Constraints

The successful replication of the PCTides results shown above is, obviously, dependent on the application of identical input data files. It is essential, therefore, that the appropriate files be correctly installed and available to the models.
